

# MODERNIZING LEGACY SOFTWARE SYSTEMS

---

Position your business to take advantage of cloud computing, mobility and virtualization.

## Modernize old software to work in line with business today.

Many systems run on older technologies that are complex, expensive, difficult to maintain, and often too rigid to help you accelerate time-to-market, improve customer service and expand into new markets. Improve your operations by increasing organizational flexibility, reducing operating costs, and fueling growth by modernizing and migrating your legacy systems, architectures, and processes.

QAT Global can show you a flexible modernization path for your legacy software systems. Our team of experts can re-engineer the architectural layers of legacy systems, including presentation layers, business logic, database and data and move them to web-enabled or more modern client / server systems.
